

# Data Analysis Portfolio

*Treat this section of your portfolio as the opening for your brand. It helps to write this section at the end, and to have a clear goal and audience in mind. Is this portfolio for a specific job or company?*

*In one or two sentences, describe your most relevant skills, unique experiences and other qualifications that make you the ideal candidate for the specific job.*

*Helpful Resource:*

<https://www.indeed.com/career-advice/career-development/guide-to-writing-a-bio-with-examples>

## Professional Background

*Give the reader a brief look at your professional background. This section is similar to a cover letter that would accompany your CV or Resume. This should be a short but clear timeline of your education, training and career. Include the most critical accomplishments from each stage of your professional career to show the employer how you have progressed.*

*An effective and creative way to create this section is to include an infographic with a timeline of your career.*

***Approx. 1pg for people with a few years of work exp.***

***Grads & people entering the workforce for the first time might have shorter backgrounds and that's ok!***

# Udemy Project Description

*In this section you need to give the reader context for the report.*

*When you do this, use the STAR Method when describing the task to a potential employer:*

*STAR stands for:*

- **Situation:** Recall the situation you were in.  
*Hint: you were given a hypothetical situation where you are presenting Udemy course data. What kind of data did you start with?*
- **Task:** What was the purpose of this report? What problem were you trying to solve? What did you have to do with the data? Or, what question(s) did you set out to answer?
- **Action:** Outline actions you took. Mention any specific methodologies you used.
- **Result:** Describe the results you achieved. What conclusions were you able to draw from the data?

<https://www.thebalancecareers.com/what-is-the-star-interview-response-technique-2061629>

**Max. 1pg**

# The Problem

*What is the business problem?*

Business Problem is something we get when something really gets out of hand while managing and even the people with us or our business talks about solution to be got and not the way of how the problem is to be solved.

*How long do you have to work on this project?*

*We have to work on this project until we get to the root of the problem and get a efficient solution.*

*What data should be collected to understand this problem? How should it be presented?*

We need to collect the data such as what courses are in trend and what is the reason manager thinks web development course will go on trend are what topics are people interested to learn so that we could increase the prices of such courses to increase the revenue. Data is to be presented on a course revenue.

*What questions would you ask to better understand the business problem?*

*Extra questions we would ask to solve the particular problem is " what are the on trend courses? " "when is the work to be submitted?" "Why and how do you think the manager thinks should we increase the revenue by increasing the prices on the courses?"*

# Design

*In what state was the data in initially? What steps did you take to “clean” the data?  
What visualisation tools have you used to share the data and why?*

Data initially was in the format where in it consisted of the redundant tables/rows and this caused complexity to take the data operations further.

## 1. CLEANING OF DATA:

### 1) Remove duplicates

Select the entire data sheet data to remove duplicates from.

Data > Remove Duplicates

### 2) Removing blank cells

- Select the entire sheet or dataset and go to **Data > Create a filter**
- Click on the Filter icon at the top of any column, then click on Filter by condition and select 'is empty'.
- Blank cells will arise to the top of the sheet and can be removed.

### 3) Headers

Ensure you have clear and concise names for headers and use dashes or underscores in between words to make it easier to parse later on.

### 4) Find and replace

If you examine the data, you will see that the Web Development subject title is not the same as other subject titles. Use the Find and Replace function to make the Web Development subject consistent with other subjects.

Edit > Find and Replace

## 2. VISUALIZATION TOOLS:

### a. EXCEL

- Excel Pivot Tables and Charts

### b. TABLEAU

### REASONS FOR USING EXCEL :

It provides us best features to visualize the data in the lookup formats and the user customized data can be viewed using various functions and V-lookup.

- Pivot Tables for business decisions. On a day to day business we work with large amounts of business data.
- Using Formulas or Functions to analyze business data
- Manage lists or business records.
- Formatting of data and sheets for presentation or viewing.

### REASONS FOR USING TABLEAU :

**Tableau, a data visualization tool**, offers new approaches to radically improve the ability to fetch hidden acumens. It leverages visual analytics that allows users to interact with data. Users can visually interact with data to get insights faster, and make critical decisions.

# Findings

*Identify your narrative and create a story that is easy to follow with your data*

*A good data story leverages three major components - Data, Narrative and Visuals. You should have already done most of the work for this in Module 5 of the program.*

*In your report you need to identify the key insights and visuals that communicate your data as efficiently as possible. You may need to write short paragraphs with each data set to communicate the narrative because, remember, your audience may not be people well-versed in Data Analytics.*

*Summarise your findings here, then create sections and subheads for each finding/data set. Your subheadings will vary depending on how you decided to tell your narrative in section 4.3. **How you tell the story is up to you, but make sure that every graphic, every table, every visualisation addresses the problem that the report aims to solve.***

## Finding 1

*Subheadings are optional. You can decide whether you need to use them or not.*

Figure 1: Sum of number of subscribers vs course title

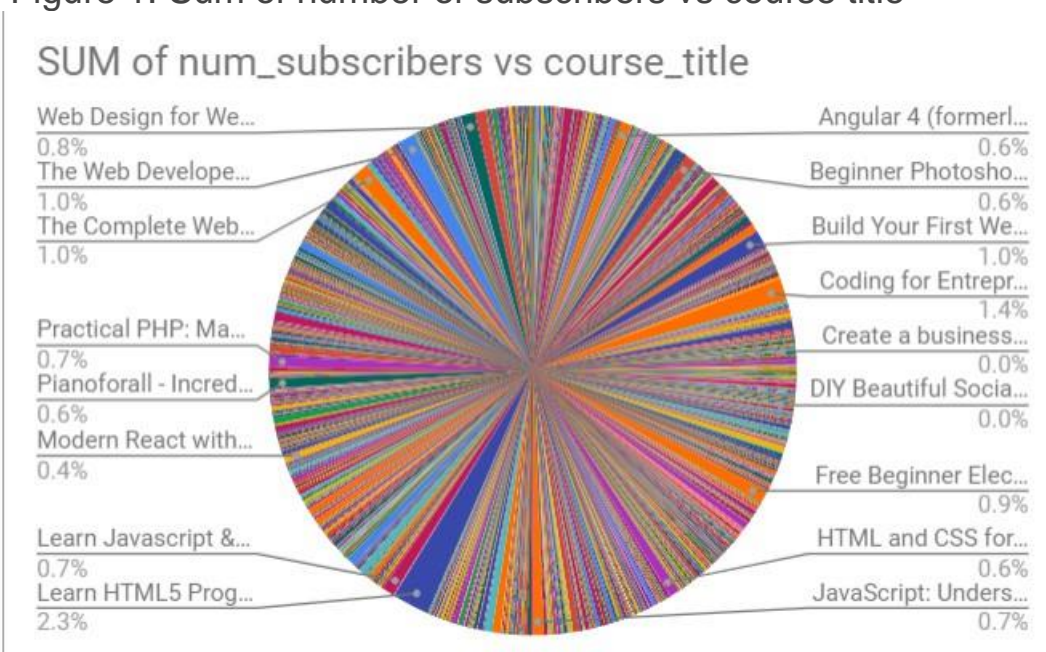

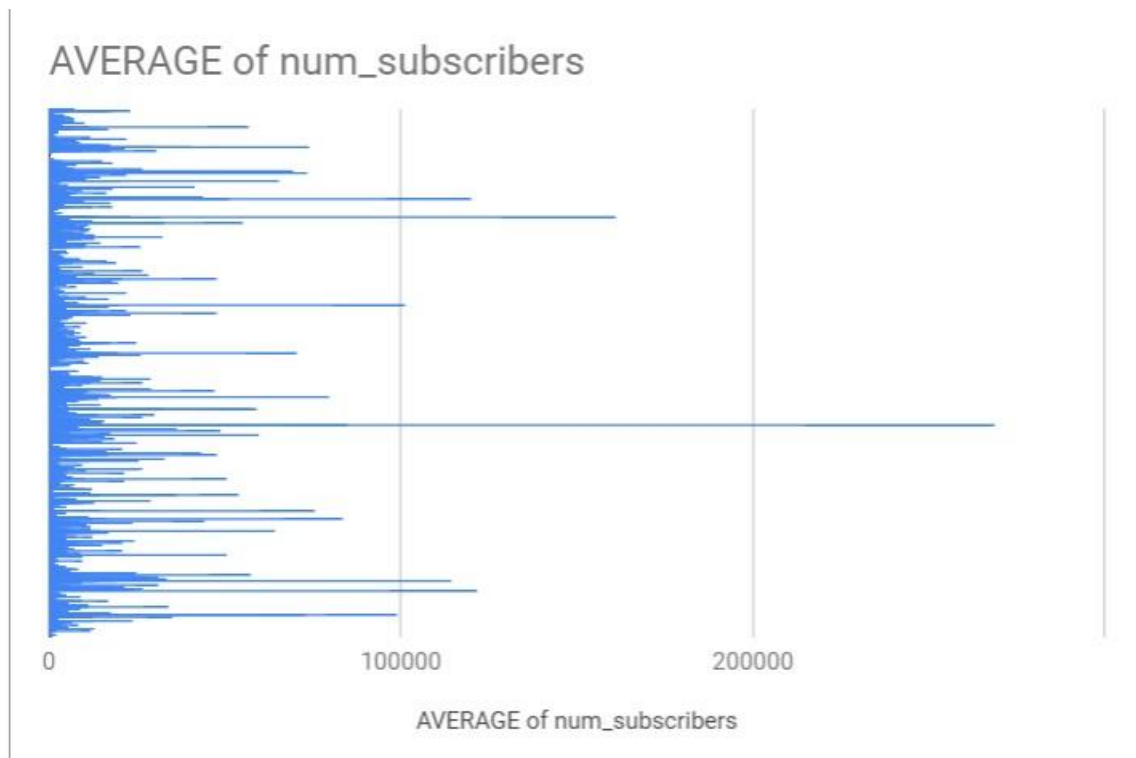

Figure 2: Average of number of subscribers

## Finding 2

Subheadings are optional. You can decide whether you need to use them or not.

# Analysis

*Your findings from the root cause/5 Whys analysis*

The 5 Whys technique is a simple and effective tool for solving problems. Its primary goal is to find the exact reason that causes a given problem by asking a sequence of “Why” questions.

- The 5 Whys method helps your team focus on finding the root cause of any problem.
- It encourages each team member to share ideas for continuous improvement, rather than blaming others.
- It gives your team the confidence that it can eliminate any problem and prevent the process from recurring failures.

# Conclusions

*If you believe that certain actions should be taken as a result of your findings, put them here*

- High degree of objectivity and neutrality of the researchers are one of the main advantages of Descriptive Analysis.
- Descriptive analysis is considered to be more vast than other quantitative methods and provide a broader picture of an event or phenomenon.
- This type of analysis is considered as a better method for collecting information that describes relationships as natural and exhibits the world as it exists
- It is considered useful for identifying variables and new hypotheses which can be further analyzed through experimental and inferential studies.
- This type of study gives the researcher the flexibility to use both quantitative and qualitative data in order to discover the properties of the population.
- In the case of surveys which consist of one of the main types of Descriptive Analysis, the researcher tends to gather data points from a relatively large number of samples unlike experimental studies that generally need smaller samples.

# Data Design

## 1. CLEANING OF DATA:

### 1) Remove duplicates

Select the entire data sheet data to remove duplicates from.

Data > Remove Duplicates

### 2) Removing blank cells
